

# SikBao

## Working Prototype

---

**Team Name: SikBao**

**06/05/18**

**Product Owner: David Trang**

**Scrum Master: Kenji Mah**

**Developers: Brian Yee, Kiran Gurung, Michael Lee**

### **Functions Not Working Correctly**

1) Recipes searching does not work 100%.

Example -> if you type in egg it will also show you recipes that have eggplant.

2) Sometimes firebase doesn't load when we open webpage. Don't know if it is because firebase is lagging.

3) When you deselect an ingredient and the recipes that incorporate that ingredient still displays.

4) If you click save recipe and there are no recipes it crashes the website

5) user can sign up with invalid email

6) When you save fridge but then log out, then create a new account and save ingredients, but then log back into the previous account and load ingredients, it deletes it from firebase

7) When logging out ingredients selected does not reset unless you refresh the page

8) HUGE mac bug. when creating account on mac computer it crashes the website, but when you reload the page the account is created.

9) When you have ingredients saved. But then you deselect all the ingredients and save the empty list, and then load your fridge, it should load an empty fridge, but it loads the previous saved the ingredients.

10) When you remove an ingredient from the list and have recipes currently displayed, the display button will not reappear.

11) You can't press [ENTER] to log in. You must manually click the "log In" button to log in

12) There is no prompt logging in with the incorrect log-in information or signing up with a current user information.

13) Adding ingredients to your fridge doesn't remove it from the full list of ingredients.

14) The profile displays the user's firebase ID

15) You can't remove recipes from your disliked list or favorite list

16) When clicking on one of your favorite recipe, it'll only display the steps and not the ingredients.

17) Clicking on a disliked recipe will not display the recipe.

18) If you delete a user's database information, the webpage will crash if the user is using a module dependent on the user's saved information .
